

# Call for FY 2017 DoD Frontier Project Proposals

---

## Introduction

**Purpose:** The Department of Defense (DoD) High Performance Computing Modernization Program (HPCMP) established DoD Frontier Projects to enable the exploration of science and technology outcomes that would not be achievable using typically available HPCMP resources. Frontier Projects pursue outcomes aligned with DoD mission priorities and are supported by multi-year investments in multi-disciplinary teams leveraging exceptional amounts of high performance computing (HPC) computational resources (i.e., 100s of millions of core-hours per year).

**Eligibility:** All Frontier Projects must be sponsored by a DoD government scientist/engineer and must use HPCMP resources to enhance mission impact and capability. Principal investigators for Frontier Projects may be scientists or engineers from government, industry, or academia. If the principal investigator is a DoD government scientist/engineer, there is no need to name a separate DoD sponsor.

**Complementarity with Existing Frontier Projects:** Proposers are encouraged to propose work that is not duplicative of existing Frontier Projects. There are eight existing Frontier Projects listed below, with their corresponding computational technology areas (CTAs):

1. Multi-scale Interactions in Stratified Turbulence, Stephen de Bruyn Kops, University of Massachusetts, sponsored by the Office of Naval Research (CFD)
2. Unsteady Pressure and Heating Environment on High-Speed Vehicles with Responding Structures, Ryan Gosse, Air Force Research Laboratory (CFD)
3. Dynamics and Properties of High-Speed Turbulent Reacting Flows, Alexei Poludnenko, Naval Research Laboratory (CFD)
4. Peta-Scale High Fidelity Simulation of Atomization and Spray/Wall Interactions at High Temperature, Luis Bravo, Army Research Laboratory (CFD)
5. Navy Electromagnetic Railgun, Joel Mejeur, Naval Surface Warfare Center (CSM, CFD, CEA)
6. Advancing DoD Modeling and Prediction Capabilities in the Arctic, Wieslaw Maslowski, Naval Postgraduate School (CWO)
7. Development of Multi-scale Models for Materials Design, Mark Gordon, Iowa State University, sponsored by the Air Force Office of Scientific Research (CCM)
8. Terminal Ballistics for Lethality and Protection Sciences, Robert Doney, Army Research Laboratory (CSM, CCM)

A summary of each of these projects is included in Attachment 1. The HPCMP seeks a balanced portfolio of Frontier Projects across the eleven CTAs (<http://www.hpc.mil/index.php/technology-areas/computational-tech-areas>). Thus, complementarity of potential new projects to existing Frontier Projects will be an important selection consideration.

**Awards:** A Frontier Project may be proposed for a two-to-five-year duration. Exceptional amounts of HPC computational resources will be provided to each project without regard to any quota based on the proposing Services/Agencies. Support is available from HPCMP assets such as the DoD Supercomputing Resource Centers (DSRCs), User Productivity Enhancement, Technology Transfer and Training (PETTT), and the Data Analysis and Assessment Center (DAAC). Leveraging a Frontier Project award with funding from other sources is encouraged.

**Project Review:** Frontier Projects will be formally reviewed once a year by the High Performance Computing Modernization Program Office (HPCMPO), with informal quarterly reviews as appropriate. Projects are expected to have frequent interaction with DSRC and PETTT support personnel.

**Submission:** All Frontier Proposals must be submitted through the appropriate Service/Agency High Performance Computing Advisory Panel (HPCAP) principal to the HPCMPO. All proposals must be at the unclassified level. Proposals must be received by the HPCMPO by 29 April 2016; however, HPCAP principals have established earlier internal deadlines. The HPCAP points-of-contact and dates for submission of proposals to the Services/Agencies are as follows:

- Air Force: Mr. Darrell Phillipson ([darrell.phillipson@us.af.mil](mailto:darrell.phillipson@us.af.mil)) and Mr. Michael Ausserer ([Michael.Ausserer@us.af.mil](mailto:Michael.Ausserer@us.af.mil)). Submit proposals by 1 April 2016.
- Army: Mr. Robert Saunders ([robert.m.saunders14.civ@mail.mil](mailto:robert.m.saunders14.civ@mail.mil)), Mr. Robert Sheroke ([Robert.M.Sheroke.civ@mail.mil](mailto:Robert.M.Sheroke.civ@mail.mil)), and Mr. Eldred Lopez ([Eldred.I.Lopez.ctr@mail.mil](mailto:Eldred.I.Lopez.ctr@mail.mil)). Submit proposals by 15 April 2016.
- Navy: Ms. Kathy Hollyer ([kathy.hollyer.ctr@navy.mil](mailto:kathy.hollyer.ctr@navy.mil)). Submit proposals by 15 April 2016.
- DTRA: Ms. Jacqueline Bell ([jacqueline.l.bell2.civ@mail.mil](mailto:jacqueline.l.bell2.civ@mail.mil)). Submit proposals by 15 April 2016.
- DARPA: Dr. Nick Lemberos ([nick.lemberos@darpa.mil](mailto:nick.lemberos@darpa.mil)). Submit proposals by 1 April 2016.
- MDA: Ms. N. Joy Regulus ([natalie.regulus@mda.mil](mailto:natalie.regulus@mda.mil)). Submit proposals by 15 April 2016.

**Evaluation:** A technical review panel convened by the HPCMPO will evaluate proposals against the following criteria:

- **Technical merit:** Based on the project's goals, solution approach, management approach, and technical quality, what is the value of the computational work to the technical communities to which the project applies?
- **Computational merit:** How efficiently can the proposed project take advantage of the high performance computing capabilities requested? Is the proposed computational approach robust and is the software (existing and/or proposed) highly scalable to achieve the desired outcomes?
- **Potential for progress:** Based on the team's qualifications and previous work, does the team have the potential to complete the proposed work?

All evaluations will be used to formulate a recommendation for project selection by the HPCMP Director. It is anticipated that awards will be announced on 30 June 2016

**Questions:** Contact Larry Davis, HPCMP Senior Scientist, [frontier@hpc.mil](mailto:frontier@hpc.mil), 703-812-4422.

## Proposal Contents

Frontier Project proposals are limited to 15 pages (single-spaced, standard 12-point font, one-inch margins) and must be a single Word document. The cover page, resource request sheets, and any curricula vitae do not count against the 15-page limit. Proposals must contain the following sections – ordered and numbered as indicated. Suggested lengths for each section are provided.

**Cover Page:** (Length: 1 page maximum; see Attachment 2)

***Project Title:*** Provide the title of the project.

***Requirements Project Number(s):*** Provide the project number(s) (as reflected in the HPCMP requirements database) representing the project requirements on which the Frontier Project proposal is based. A proposal cannot be considered unless its resource requirements are reflected in the HPCMP requirements database. Please contact Cathy McDonald at [require@hpc.mil](mailto:require@hpc.mil) for further details.

***CTA:*** List the primary and associated CTAs that best fit this project (see <http://www.hpc.mil/index.php/technology-areas/computational-tech-areas>).

***Duration:*** Specify the expected duration of the project, in years.

***Estimated Core-hours by Year:*** Summarize the total estimated computational requirement described on the Project Resource Request sheets by year, in millions of core-hours.

***Government Sponsor:*** Provide the Government sponsor's name and contact information, if the principal investigator is not a DoD government scientist/engineer.

***Principal Investigator:*** Provide the Frontier Project’s principal investigator’s name and contact information. Only one person should be listed, and that person will be the lead for interactions with the HPCMP during the project.

***Key Collaborators:*** Provide a list of organizations or personnel planned to participate in the project.

***Technical Goals and Approach:*** Summarize the technical objectives of the project and the planned computational approach.

***Major Applications Software:*** List major applications software that will be used.

***Technical & Computational Challenges:*** Summarize anticipated challenges for the project and the planned computational approach.

***DoD Impact:*** Summarize the projected DoD impact.

***Community Impact:*** Summarize the projected impact on the scientific and engineering community.

**Technical Proposal:** Include the following topics in the proposal narrative:

***Introduction:*** Introduce the project in broad terms. Include a general discussion of ongoing related work in both your organization and the scientific, technology, and/or testing community. (Length: approximately ½ to 1 page)

***DoD Impact:*** Clearly state the DoD mission impact of the project and any current and future programs of record it will support. State the advantage to be gained by exploiting HPC capability. (Length: approximately ½ to 1 page)

***Technical Approach:*** Clearly state the technical goals of the project, and discuss the science, technology, and/or engineering activities that are required to meet these goals. Provide a plan for achieving these goals. Discuss technical challenges that will likely be encountered during the course of the project and how they will be overcome. (Length: approximately 3-6 pages)

***Timeline and Anticipated Accomplishments:*** State clearly the duration of the project and provide a schedule in tabular form with estimated milestones and anticipated accomplishments for each year. (Length: approximately ½ to 1 page)

***Computational Approach:*** Describe the computational methodology and algorithms, and estimate the size of the problem with as many supporting details as possible. Discuss the relationship between early year developments and later year accomplishments. Discuss applicable software efficiency on scalable systems by stating the performance as a function of the degree of parallelism. Show evidence that the software provides sufficient foundation to scale to the problem size needed to achieve the goals of the project and/or discuss software

developments that will be required as a part of the project. Scalability information, including a graph of application performance for a typical test case versus the number of cores, should be included. Discuss optimal computational architectures relative to available HPCMP resources. Discuss the computational challenges that will likely be encountered during the course of the project and how they will be overcome. (Length: approximately 2-4 pages).

***Progress to Date:*** Discuss preparatory work in the proposed technical area in this section. Elaborate on any HPC resources previously used by this project and/or efforts leading up to this proposed project. Discuss what work remains and how a Frontier Project can facilitate achieving the proposed work. (Length: approximately ½ to 2 pages)

***Key Personnel:*** Identify the key personnel who will work on this project, and summarize the background and qualifications of each participant, and projected level of effort. Provide an estimate of the size of the group that will perform this work including discussion of possible incorporation of HPCMP team members (see below) into the project team. (Length: approximately 1-2 pages)

***Required Computational Resources and Justification:*** Outline the computational resources required to accomplish this project in terms of total core-hours on specific HPCMP systems for FY 2017 and FY 2018. These early year requirements should be definitive and reasonably accurate. For the out-years, an estimated number of core-hours on some generic system expected to be available during those out-years may be stated. A list of current HPCMP systems is available at <http://centers.hpc.mil>. Justification for the required level of computational resources can be provided by documenting known run times on the same or similar architectures as proposed for the project and scaling those to address the project's goals. Include a discussion of any specialized memory, storage, networking, and/or software requirements. (Length: approximately 1-3 pages)

***Computational Summary Sheet:*** Provide estimates of computational resources required to accomplish the proposed project. A completed DoD Frontier Project Resource Request (see Attachment 3; not part of 15-page limit) for each year of the proposed project is required. The form is divided into three sections:

- Section I: Specify the applicable year and enter the principal investigator information.
- Section II: There are two tables in Section II. The first table facilitates outlining suites of systems at various locations that can address the project's requirements. Proposals may present multiple scenarios (combinations of platforms and locations). The second table, which contains computational processor, memory, and data archive storage requirements, must be completed once for each year of the project.
- Section III: Enter the computational project titles and project numbers (as reflected in the HPCMP Requirements database) associated with the project. Please contact Cathy McDonald at [require@hpc.mil](mailto:require@hpc.mil) if you need assistance with this.

***Curricula Vitae:*** Provide a *curriculum vita* (including a list of relevant publications) for each of the key personnel. (Not part of 15-page limit)

# Attachment 1

## Summary of Existing Frontier Projects

---

### **Multi-scale Interactions in Stratified Turbulence (Stephen de Bruyn Kops, University of Massachusetts, sponsored by the Office of Naval Research)**

The technical goal of this project is to generate research simulations at Reynolds numbers that are relevant to engineering problems in the ocean or atmosphere. In addition, turbulence subjected to stabilizing buoyancy forces will be modeled so that fast simulations can accurately predict the performance of vehicles, sensors, and weapons in the deep ocean and atmosphere. Very large direct numerical simulations of simple flow configurations will be performed in order to understand the dynamics of stratified turbulence.

### **Unsteady Pressure and Heating Environment on High-Speed Vehicles with Responding Structures (Ryan Gosse, Air Force Research Laboratory)**

This Frontier Project seeks to determine the fully-coupled high fidelity fluid-thermal-structural response of high-speed vehicles at full scale that resolves all relevant physics of the fluid and structure domains. Specific coupled computational fluid dynamics (CFD) and structural application codes will be optimized, scaled, and tested for their ability to address important flow features in boundary layers. These techniques will be applied to hypersonic Air Force strike weapons to impact and control costs for test programs of these vehicles.

### **Dynamics and Properties of High-Speed Turbulent Reacting Flows: From a Jet Engine to an Exploding Star (Alexei Poludnenko, Naval Research Laboratory)**

The uniform grid and static mesh refinement code Athena-RFX will be developed and tested by incorporating detailed kinetic reaction models for light hydrocarbon fuels and thermal/barodiffusion. A systematic study will be performed of turbulent flames in H<sub>2</sub>-air, H<sub>2</sub>-CO, and light hydrocarbon fuels for a broad range of turbulent intensities, system sizes, and equivalence ratios, both in the pre-mixed and non-pre-mixed regimes. The results will advance the fundamental understanding of high-speed, turbulent, reacting flows that will impact a number of systems of interest to DoD, including scramjet engines for hypersonic flight and detonation-based engines for efficient onboard power generation and propulsion.

### **Petascale High Fidelity Simulation of Atomization and Spray/Wall Interactions at High Temperature and Pressure Conditions (Luis Bravo, Army Research Laboratory)**

This project seeks to perform extensive three-dimensional simulations of the mixture formation process in direct injection engines, with a particular emphasis on the spray atomization process and spray/wall interactions. An understanding of the complex physics involved in these processes from these simulations will be used to enhance current engineering models for predicting these processes. The outcomes of this project will include both new high-fidelity direct Navier-Stokes simulation codes as well as the detailed understanding of these processes, which can then be used to improve several Army direct injection engine technologies by increasing power density and engine efficiency, while reducing battlefield signatures.

### **Navy Electromagnetic Railgun (Joel Mejeur, Naval Surface Warfare Center)**

This Frontier Project will support basic science and applied studies on development of the electromagnetic railgun launcher technologies. These studies will improve understanding of the phenomena that occur at the dynamic, molten aluminum interface between the armature and the rail, provide boundary conditions for modeling the interface layer, and develop detailed multi-physics models of the railgun launcher to assist with detailed analysis of the launcher performance. This detailed understanding of processes within the railgun will directly improve the efficiency of designing such systems.

### **Advancing DoD Modeling and Prediction Capabilities in the Arctic (Wieslaw Maslowski, Naval Postgraduate School)**

This Frontier Project has the overall goal of advancing the understanding of and resolving processes and feedbacks controlling the operation of the Arctic region's ocean and sea ice systems, reduce uncertainty in modeling those systems, and improve the prediction of Arctic sea ice and climate using state-of-the-art modeling applications. The results of this work will aid Arctic stewardship and U.S. interests in line with DoD and national strategies for the Arctic region and provide accurate projections of regional climate change.

## **Development of Multi-scale Models for Material Design (Mark Gordon, Iowa State University, sponsored by the Air Force Office of Scientific Research)**

This Frontier Project's goal is the development and application of a multi-scale method that seamlessly integrates electronic structure theory methods, parameter-free coarse-graining methods, and molecular dynamics/Monte Carlo simulation methods to provide accurate and efficient predictions of bulk properties of advanced materials, without the need for empirically fitted parameters. The new multiscale simulation methods will be implemented in the widely-used GAMESS code, thus making these new capabilities available to a broad user base in government, industry, and academia. The methodologies will be applied to accurate computation of the properties of ionic liquids, which, as potential new propellants, may have significant impacts to DoD, including (a) reliable and cost effective access to space, (b) improved satellite maneuverability and increased on-orbit lifetime, and (c) reduction of environmental and toxicological hazards and improved safety associated with propellant storage and handling.

## **Terminal Ballistics for Lethality and Protection Sciences (Robert Doney, Army Research Laboratory)**

This Frontier Project seeks to advance the state-of-the-art in terminal ballistics by focusing on three themes: rigorous uncertainty quantification of ballistic events, understanding human response to ballistic loading, and breakthrough capability for materials modeling. Each area requires multi-scale continuum and mesoscale modeling capability. Successful investigation of these three themes will further develop the quality of shock physics codes which provide critical modeling capability to enable significant DoD advances in armor, lethality, and hypervelocity impact.

## DoD Frontier Project Resource Request

---

### DoD Frontier Project Resource Request

#### **Section I: General Information**

Project Number and Title: \_\_\_\_\_

Project Year: \_\_\_\_\_

Principal Investigator:

Name: \_\_\_\_\_

Service/Agency: \_\_\_\_\_

Organization: \_\_\_\_\_

Address, City, State, and Zip Code: \_\_\_\_\_

\_\_\_\_\_

E-Mail Address: \_\_\_\_\_

Phone: \_\_\_\_\_

#### **Section II: Overall Project Resource Requirements**

Platform(s)	Location (DSRC)		CPU Resources (core-hours)	
	First Choice	Second Choice	Request	Minimum Acceptable

*Note: If needed, insert multiple copies of the table above.*

<b>Platform(s)</b>	<b>Typical Number of Processors</b>	<b>Maximum Number of Processors</b>	<b>Typical Job Memory (GB)</b>	<b>Maximum Job Memory (GB)</b>	<b>Total Data Archive Storage Requirements (TB)</b>

Total Expected Working Storage Requirements (in TB): \_\_\_\_\_

Annual Expected Archival Storage Requirements (per year in TB): \_\_\_\_\_

### **Section III: Requirements Project Information**

#### **HPCMP Requirements Database Information:**

Project Title from HPCMP Requirements Database: \_\_\_\_\_

Project Number from HPCMP Requirement Database: \_\_\_\_\_
